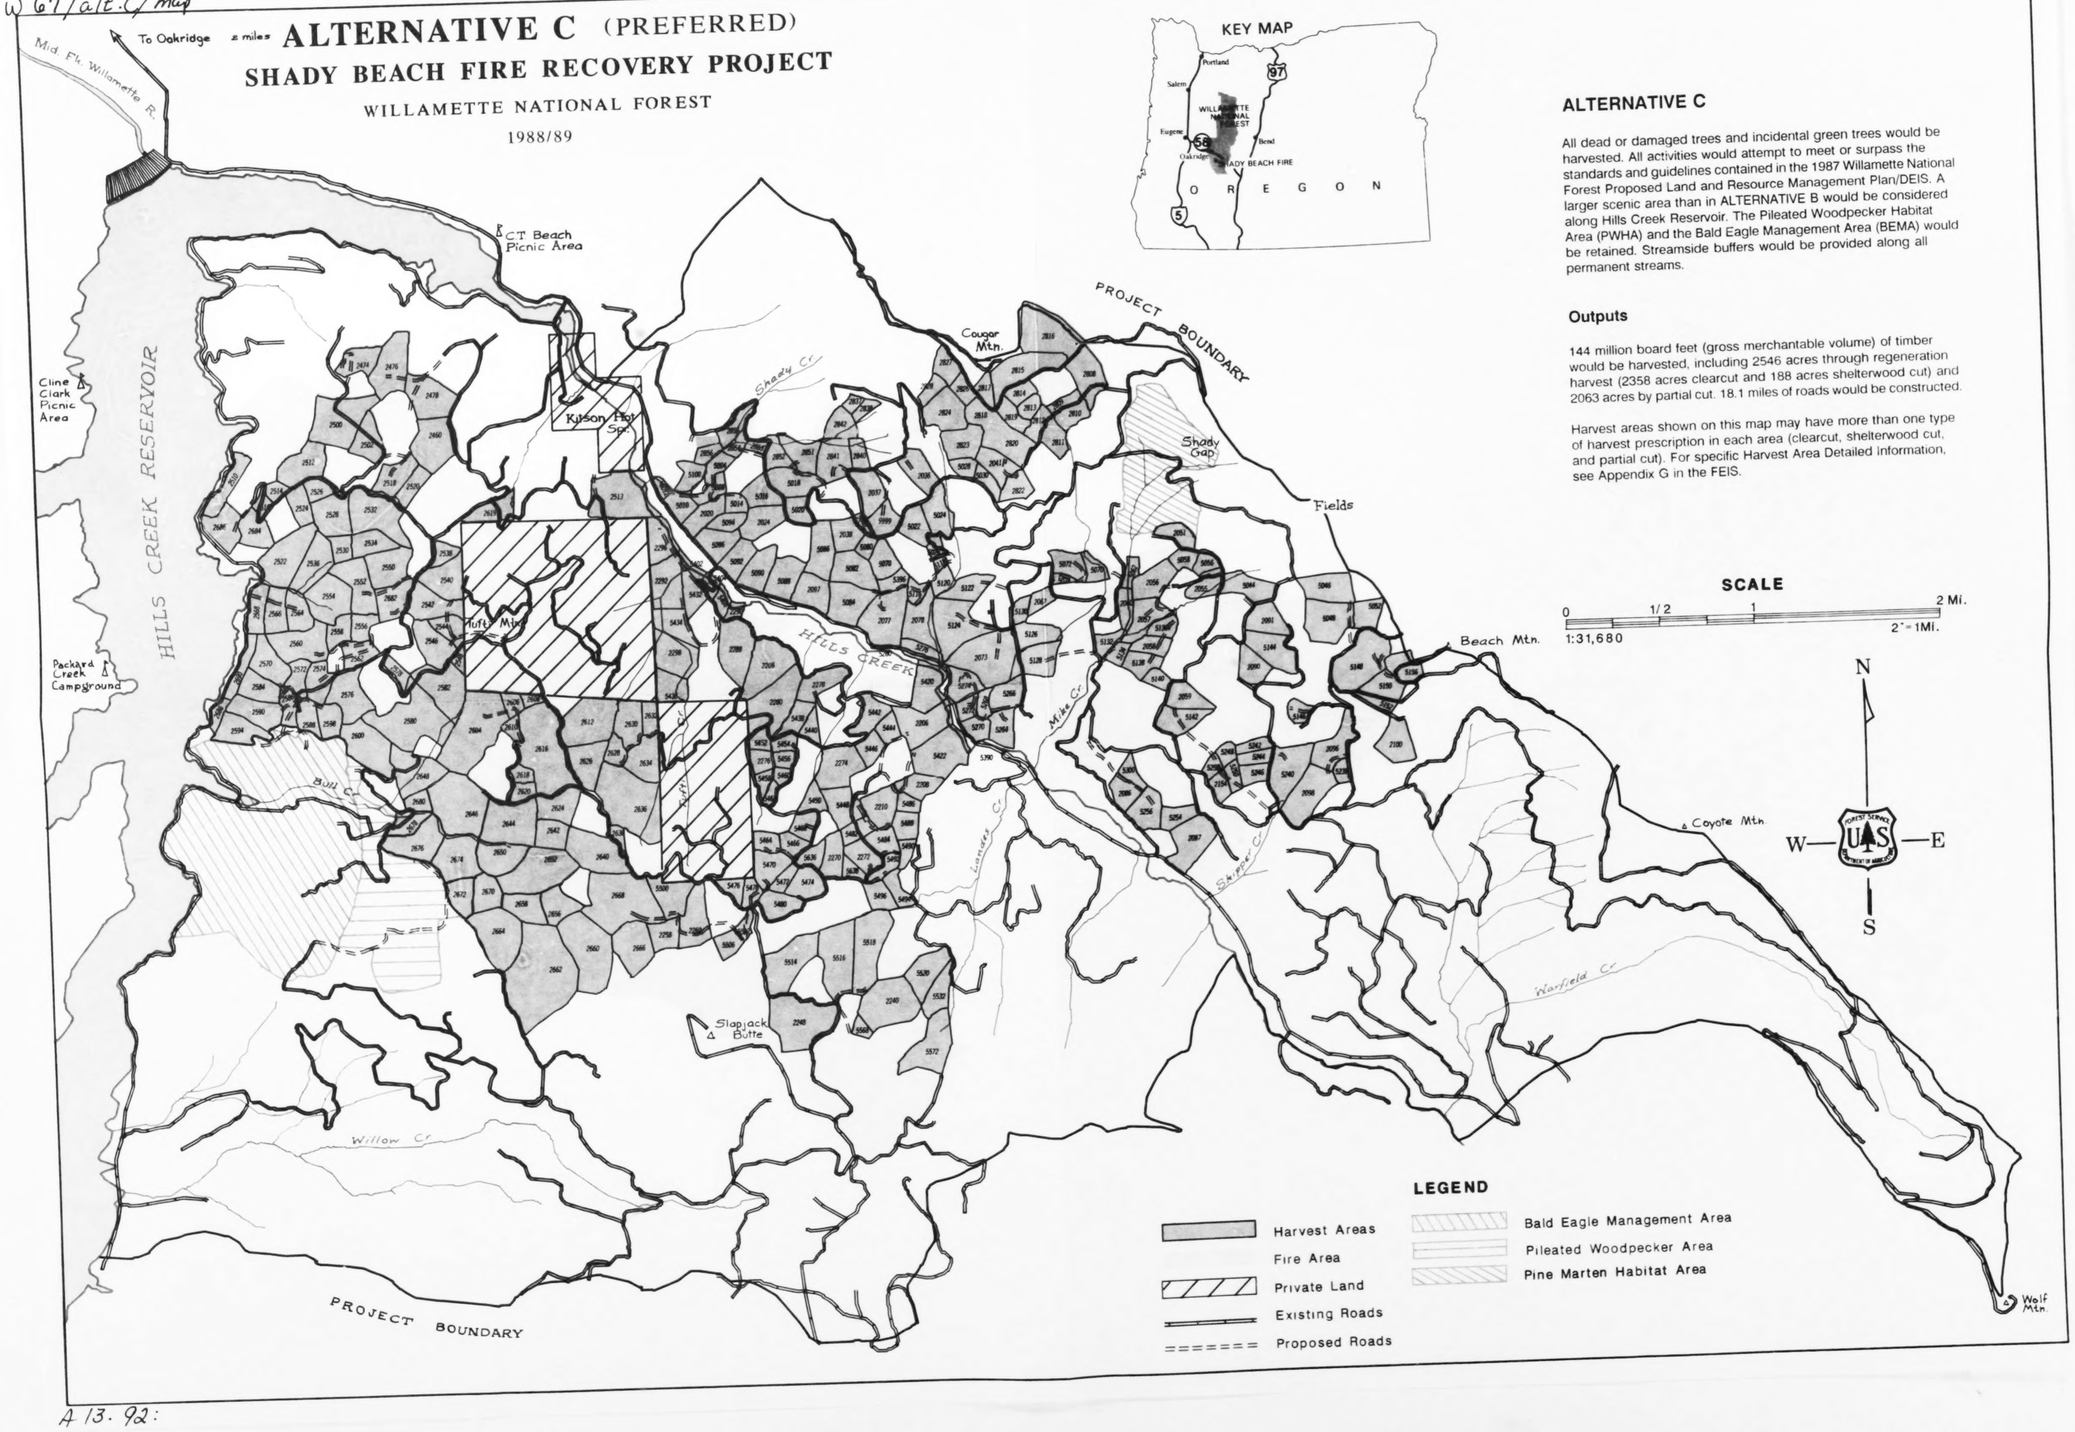
ALTERNATIVE C (PREFERRED)

SHADY BEACH FIRE RECOVERY PROJECT

WILLAMETTE NATIONAL FOREST

1988/89



ALTERNATIVE C

All dead or damaged trees and incidental green trees would be harvested. All activities would attempt to meet or surpass the standards and guidelines contained in the 1987 Willamette National Forest Proposed Land and Resource Management Plan/DEIS. A larger scenic area than in ALTERNATIVE B would be considered along Hills Creek Reservoir. The Pileated Woodpecker Habitat Area (PWHA) and the Bald Eagle Management Area (BEMA) would be retained. Streamside buffers would be provided along all permanent streams.

Outputs

144 million board feet (gross merchantable volume) of timber would be harvested, including 2546 acres through regeneration harvest (2358 acres clearcut and 188 acres shelterwood cut) and 2063 acres by partial cut. 18.1 miles of roads would be constructed.

Harvest areas shown on this map may have more than one type of harvest prescription in each area (clearcut, shelterwood cut, and partial cut). For specific Harvest Area Detailed information, see Appendix G in the FEIS.
